

Python Tuples

REVIEW: Python Collection Data Types

- **LIST** – elements in the **list can change**. The list contains the **same data type**.
- **TUPLE**
- **SET**
- **DICTIONARY**

Python Collection **Data Types**

- LIST
- **TUPLE** – elements in the **list cannot be changed**.
The list can **contain mixed data types**.
- SET
- DICTIONARY

(Tuples)

vs.

[Lists]

(Tuples) are **not** immutable.

- **Cannot** Change, Add, or Remove Elements from the tuple.

[Lists] are **mutable**.

- Lists **can change**. Elements added, removed or changed.

Tuple = (uses parenthesis)

tupleEmpty = ()

#Empty Tuple

tupleNum = (1, 2, 3)

#Tuple with Integers

tupleString = ("apple", "banana", "cherry")

#Tuple with Strings

tupleMix = (1, "Hello", 3.4)

#Tuple with **Mixed Data
Types**

Tuple Examples

```
vowels = ("a", "e", "i", "o", "u")
```

```
tupleNum = (1, 2, 3, 4, 5)
```

```
tupleLang = ("Python", "PHP", "JavaScript")
```

Tuple – Examples

```
my_tuple = ("Hello",)
```

#Tuple with 1 element needs to **end with ,** to indicate that it is a tuple.

Tuple – Can have **mixed data types**

- A tuple can have any number of items and they may be of different types (integer, float, [list], "string" etc.)

```
tupleMix = ("mouse", [8, 4, 6], (1, 2, 3))
```

Access Items in a Tuple – [Index number]

```
fruitTup = ("apple", "banana", "cherry")
```

```
print(fruitTup[0])
```

```
print(fruitTup[1])
```

```
print(fruitTup[2])
```

	0	1	2
fruitTup	fruitTup[0]	fruitTup[1]	fruitTup[2]
	apple	banana	cherry

Working with Tuples

```
tupleNum = (1, 2, 3, 4, 5)
```

```
tupleLang = ("Python", "PHP", "JavaScript", "Java", "Visual Basic")
```

METHOD 1: Traverse over a Tuple using a **for loop**

```
fruitTup = ("apple", "banana", "cherry")
```

```
for item in fruitTup:  
    print(item)
```

item	0	1	2
fruitTup	fruitTup[0]	fruitTup[1]	fruitTup[2]
	apple	banana	cherry

Check if Item Exists in a Tuple – **in** keyword

```
fruitTup = ("apple", "banana", "cherry")
```

```
if "apple" in fruitTup:  
    print("Yes, 'apple' is in the fruit tuple")
```

Slicing a Tuple – accessing certain elements in tuple

```
fruitTup = ("apple", "banana", "cherry", "orange", "kiwi", "melon", "mango")  
print(fruitTup[2:5])
```

Tuple Operations

1. Creating a Tuple
2. Accessing a Tuple Element – use their index number (Negative Indexing)
3. Slicing a Tuple
4. Changing a Tuple Element - **cannot**, tuples are **not immutable (unchangeable)**.
5. Adding to a Tuple - **cannot**, tuples are **not immutable (unchangeable)**.
6. Deleting a Tuple Element - **cannot**, tuples are **not immutable (unchangeable)**.
7. Deleting an entire tuple only.
8. Check if Item **in** Tuple
9. Determine Tuple length
